

HYCloud

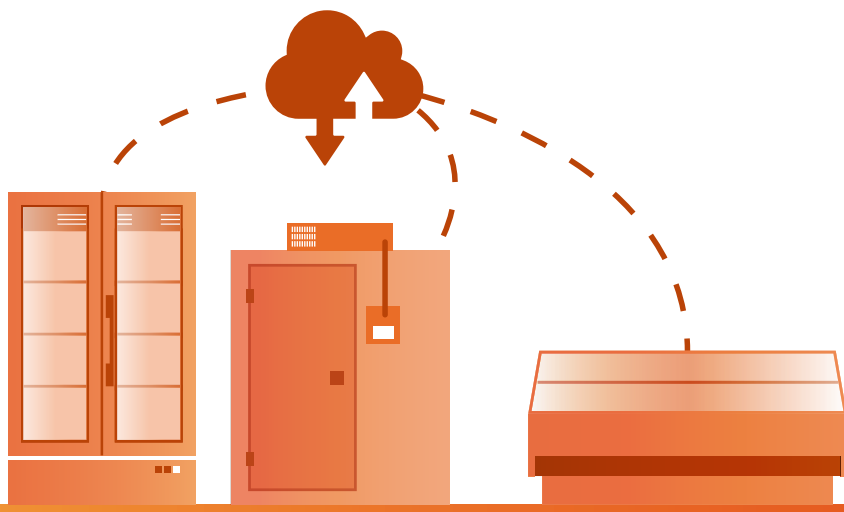

Web platform for IIoT solutions

HYterm
IIoT Solutions for Air Heat Exchanger
and Ventilation Systems

HYCloud

HyCloud is the service offered by Hyterm. It provides the remote control and monitoring of unattended machines and plants. Available through the web, it doesn't require any installation and, thanks to a simple and intuitive user interface, allows to read data directly from a PC or mobile device.

SAFE

HyCloud enhances the safety of refrigeration systems by preventing interruptions in the cold chain, which could otherwise lead to significant financial losses for commercial activities.

HACCP REPORT

HyCloud sends the HACCP reports of monitored equipment directly to your email inbox.

PREDICTIVE MAINTENANCE

HyCloud analyses the collected data with the aim of preventing system downtime through timely and targeted maintenance interventions.

DATA HISTORY

HyCloud shows the history of machines and systems in tabular or graphical form based on the collected data.

PERFORMANCE IMPROVEMENT

Thanks to the collected data, HyCloud provides an in-depth understanding of refrigeration system operations, enabling fine-tuning that improves efficiency while reducing energy consumption.

CUSTOMIZABLE

The dashboard allows users to customise the interface according to the specific characteristics of each system. Programmable alarms and personalized messages speed up problem resolution.

FLEXIBLE

HyCloud is natively compatible with all HYTERM products, but thanks to its versatility it can also interface with any other device available on the market. Its flexibility also makes it suitable for retrofitting existing refrigeration systems already installed in the field.
